A,Accession: A21910
A,Accession: A21910
A,Molecule type: protein
A,Residues: 22-38,'H',40-42,'N',44-67,'T',69-90,'N',92-124 <TAK>
A,Experimental source: biotype Inaba 569B
A,Note: Asn-65 was partially deaminated to Asp
C;Comment: The authors translated the codon TCA for residue 33 as Tyr.
C;Gometics: A,Gene: VC1456
A,Map position: I
C;Complex: the cholera enterotoxin molecule contains three kinds of chains; an alpha ciate noncovalently with the subunit B, an aggregate of five beta chains
C;Function: involved in binding of the toxin to cell membranes
C;Function: A,Description: toxin beta chain
C;Keywords: enterotoxin; toxin

                                                                                                                                                                                                                                                                                                                                                                     -!- SUBUNIT: MONOMER.
-!- SIMILARITY: BELONGS TO THE QUEUINE TRNA-RIBOSYLTRANSFERASE FAMILY.
-!- CAUTION: REF.2 SEQUENCE DIFFERS FROM THAT SHOWN EXTENSIVELY DUE
studies of inhibitors of tRNA-guanine transglycosylase.";
Submitted (MAR-2000) to the PDB data bank.

-!- FUNCTION: EXCHANGES THE GUANINE RESIDUE WITH 7-AMINOMETHYL-7-
DEAZAGUANINE IN TRNAS WITH GU(N) AWINICODONS (TRNA-ASP, -ASN, -HIS
AND -TXR). AFTER THIS EXCHANGE, A CYCLOPENTENDIOL MOIETY IS
ATTACHED TO THE 7-AMINOMETHYL GROUP OF 7-DEAZAGUANINE, RESULTING
IN THE HYPERMODIFIED NUCLEOSIDE QUEUGSINE (Q) (7-((4,5-CIS-
DINYDROXY-2-CYCLOPENTEN-1-Y1)AMINO)METHYL)-7-DEAZAGUANOSINE).

C -!- FUNCTION: DEGRADES EXTRACELLULAR MATRIX. PROPOSED TO PLAY A ROLE
IN BREAST CANCER INVASION MAD METASTASIS. EXHIBITS TRYPSIN-LIKE
C OR LYS AS THE P1 SITE
C -!- SUBLEMENTY: CONTAINS 4 LDL-RECEPTOR CLASS A DOMAINS.
C -!- SIMILARITY: CONTAINS 2 CUB DOMAINS.
C -!- SIMILARITY: BELONGS TO PEPTIDASE FAMILY S1; ALSO KNOWN AS THE
TRYPSIN FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             CYTOPLASMIC (POTENTIAL).

"Transcript regulation and carboxyterminal extension of ubiquitin in
Dictyostellum discoldeum":
FEBS Lett. 209:92-96(1986).
-I- FUNCTION: INVOLUED IN THE ATP-DEPENDENT SELECTIVE DEGRADATION OF
CELLULAR PROFEINS, THE MAINTENANCE OF CHROMATIN STRUCTURE,
REGULATION OF GENE EXPRESSION, THE STRESS RESPONSE, AND RIBOSOME
                                                                                                               MEDLINE-87257921; PubMed-3037345;
Giorda R., Enhis H.L.;
"Structure of developmentally regulated Dictyostelium discoideum
ubiquitin genes.";
                                                                                                                                                                                                                                                                                                                                          SUBCELLULAR LOCATION: NUCLEAR AND CYTOPLASMIC.
MISCELLANEOUS: UBIQUITIN IS SYNTHESIZED AS A POLYUBIQUITIN
PRECURSOR WITH EXACT HEAD TO TAIL REPEATS. SOME UBIQUITIN GENES
CONTAIN A SINGLE COPY OF UBIQUITIN FUSED TO A RIBOSOMAL PROTEIN.

-!- SUBUNIT: ARCHAEAL SIGNAL RECOGNITION PARTICLE CONSISTS OF A 7S RNA MOLECULE OF 300 NUCLEOTIDES AND TWO PROTEIN SUBUNITS: SRF54 AND SRP19 (BY SIMILARITY).
-!- SUBCELLULAR LOCATION: CYTOPLASMIC (BY SIMILARITY).
-!- DOMAIN: HAS A TWO DOMAIN STRUCTURE: THE G-DOMAIN BINDS GTP; THE M-DOMAIN BINDS THE 7S RNA IN PRESENCE OF SRP19 AND ALSO BINDS THE SIGNAL SEQUENCE (BY SIMILARITY).
-!- SIMILARITY: BELONGS TO THE SRP FAMILY OF GTP-BINDING PROTEINS.
                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       -: FUNCTION: RECEPTOR FOR INTERLEUKIN-7.
-: SUBGNIT: HETERODIMER OF AN ALPHA CHAIN AND A COMMON GAMMA CHAIN.
-: SUBCELLUAR LOCATION: TYPE I MEMBRANE PROTEIN.
-: TISSUE SPECIFICITY: SPLEEN; TYPMUS; AND FETAL LIVER.
-: SIMILARITY: BELONGS TO THE CYTOKINE FAMILY OF RECEPTORS.
-: SIMILARITY: CONTAINS I FIBRONECTIN TYPE III-LIKE DOMAIN.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              g
                                                                                       The invention relates to peptide fragments of the Escherichia coli heat labile enterotoxin (Etx) and its closely related homologue, cholera toxin (Ctx) from vibrio cholerae which do not bind to the ubiquitous GM-I ganglioside receptors on host cell surfaces. Both Etx and Ctx are composed of one A subunit and five identical B subunits. The A subunit CC is responsible for toxicity, possessing adenosine diphosphate (ADP) ADP-ribosyltransferase activity, while the B subunits (EtxB and CtxB) actilitate the entry of subunit A into the host cell via the binding and cross-linking of GM-I receptors. Although GM-I binding is responsible for some of the effects of Etx and Ctx, it has been found that certain effects of the toxins, such as immunomodulation, are not mediated beta-4 - alpha-2 loop of EtxB and/or CtxB, exerting the same effects as cormal EtxB and CtxB subunits, except that they do not bind or cross link can any also be used as an inhibitor for toxin-induced diarrhoea. Therefore, the peptides may be used in the production of a composition for treating, preventing and/or modulating a disease associated with an immune disorder and/or toxin-induced diarrhoea. Sequences AAY87460 being repetively.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 0

The pertussis holotoxin modification process comprises: (1) identification of at least one amino acid (aa) residue of the holotoxin for modification by analysing the 3-dimensional form of the crystalline holotoxin, in relation to known information of the protein structure and function; (2) effecting mutagenesis (by removing or replacing a nucleotide sequence encoding at least one (aa)) of a tox operon; and (3) expressing mutant tox box in a Bordetella organism to produce the modified holotoxin. This method is used for modifying pertussis holotoxin, by studying its 3-dimensional crystalline structure. Modifying the holotoxin, alters its biological properties. By analysing the 3-dimensional crystalline structure of the pertussis
